

FR30z treadmill controller

Six screens, static hi-fi, iPhone 16 Pro. The Exercise screen keeps the countdown and the requested-vs-actual panel on the top half, the two dials on the thumb half, and the full plan behind an upward swipe.

1a Import · plan preview

The model's job ends at the schema. The verdict badge and the clamp annotations come from local validation, and the totals are computed by the app — not quoted from the response.

Name and save

1b Preflight

One screen that answers "can this run right now" — readiness, the ceilings that will be enforced, and the activity type confirmed before the belt moves.

1c Exercise · portrait

Top half is read-only: countdown, then one panel that puts requested next to actual for both axes. Incline is shown mid-flight — target 3.0, machine still at 2.0, command unacknowledged. Bottom half is nothing but controls, all ≥ 56 px.

1d Exercise · landscape

Phone docked on the console rail. Same three facts, no scrolling: progress on the left, the two axes centre, stop always under the right hand.

Summary plus the heart-rate trace, with the Health save state stated plainly and the deeper telemetry left behind Export JSON.

1f Apple Watch · two faces

Left: the glance — heart rate and time left in the rep. Right: crown turned, so the face becomes a single speed target and stays there until the phone acknowledges.
